What you should know about approximate dynamic ...

of solving a stochastic optimization problem, approximate dynamic programming specifically focuses on using Bellman's equation. The remainder of this article provides a brief introduction to the very rich field known as approximate dynamic programming (ADP). As of this writing, there are three books

Approximate Dynamic Programming via Iterated Bellman ...

Approximate Dynamic Programming via families, our method is based on solving a convex optimization problem, thus avoiding the 'curses of dimensionality' usually associated with dynamic programming [5]. The bound we compute can be compared ...

Two Approximate Dynamic Programming Algorithms for ...

Third, approximate dynamic programming (ADP) approaches explicitly estimate the values of states to derive optimal actions. For example, mean-field approximation algorithms [10, 20, 23] and approximate linear programming methods [6] approximate the value function by decomposing it into a sum of the values of each node.

APPROXIMATE DYNAMIC PROGRAMMING I: MODELING

of dimensionality of dynamic programming. Approximate dynamic programming (ADP) is both a modeling and algorithmic framework for solving stochastic optimization problems. Most of the literature has focused on the problem of approximating $V(s)$ to overcome the problem of multidimensional state variables. In addition to the problem

THE LINEAR PROGRAMMING APPROACH TO APPROXIMATE ...

of approximate dynamic programming in industry. Limited understanding also affects the linear programming approach; in particular, although the algorithm was introduced by Schweitzer and Seidmann more than 15 years ago, there has been virtually no theory explaining its behavior.

Deep Learning Approximation for Stochastic Control Problems

the operations research (OR) community has been "approximate dynamic programming" (ADP) [7]. There are two essential steps in ADP. The first is replacing the true value function using some function approximation. The second is advancing forward in time from a sample path with backward sweep to update the value function.

Approximate Dynamic Programming via Linear Programming

Let us now introduce the linear programming approach to approximate dynamic programming Given pre-selected basis functions $\{ \phi_1, \dots, \phi_K \}$, define a matrix $\Phi = [\phi_1 \dots \phi_K]$ With an aim of computing a weight vector $f \in \mathbb{R}^K$ such that Φf is a close approximation to J^* , one might pose the following optimization problem: $\max_{f \in \mathbb{R}^K} \|\Phi f - J^*\|_r$ (2)
